Kuratowski's theorem

Trees

# Bipartite graph

- ▶ A bipartite graph, also called a bigraph, is a set of graph vertices decomposed into two disjoint sets such that no two graph vertices within the same set are adjacent.
- ▶ Bipartite graphs are equivalent to two-colorable graphs.
- ▶ All acyclic graphs are bipartite.
- ▶ A cyclic graph is bipartite iff all its cycles are of even length

# Bipartite graph

# Outline

Bipartite graph

Perfect matching

Planar graphs

Kuratowski's theorem

Trees

# Perfect matching

A perfect matching of a graph is a matching (i.e., an independent edge set) in which every vertex of the graph is incident to exactly one edge of the matching.

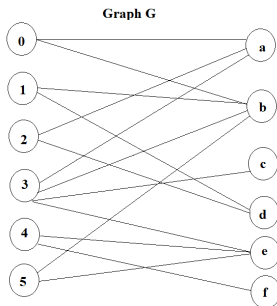

A perfect matching is therefore a matching containing  $\frac{n}{2}$  edges (the largest possible), meaning perfect matchings are only possible on graphs with an even number of vertices.

# Perfect matching

Halls Theorem: Let  $G = (X, Y)$  be a bipartite graph. Then  $X$  has a perfect matching into  $Y$  if and only if for all  $T \subseteq X$ , the inequality  $|T| \leq |N(T)|$  holds. Where  $N(T)$  is the set of all neighbors of the vertices in  $T$ . In other words,  $y \in Y$  is an element of  $N(T)$  if and only if there is a vertex  $x \in T$  so that  $xy$  is an edge.

## Perfect matching

You are given two bipartite graph G and H below. For each graph determine whether it has a perfect matching. Justify your answer, either by listing the edges that are in the matching or use Hall's Theorem to show that the graph does not have a perfect matching.

# Perfect matching

$$T = \{1, 2, 3, 4\}$$

$$N(T) = \{a, b, c, d, e, f\}$$

Bipartite graph

Perfect matching

Planar graphs

Kuratowski's theorem

Trees

# Planar graphs

Is it possible to join these houses and utilities so that none of the connections cross?

# Planar graphs

## Definition 3.1

A graph is called planar if it can be drawn in the plane without any edges crossing. Such a drawing is called a planar representation of the graph.

# Examples

Figure: The  $K_4$  graph and its drawn with no crossings.

# Examples

Figure: A  $Q_3$  graph.

# Examples

Figure: The planar representation of a  $Q_3$  graph.

# Euler's Formula

- ▶ A planar representation of a graph splits the plane into regions (including an unbounded region.)
- ▶ Euler showed that all planar representations of a graph split the plane into the same number of regions.
- ▶ There is a relationship between the number of regions, vertices and edges.

# Euler's Formula

Figure: The Regions of the Planar Representation of a Graph.

# Euler's Formula

## Theorem 1 (EULER'S FORMULA)

*Let  $G$  be a connected planar simple graph with  $e$  edges and  $v$  vertices. Let  $r$  be the number of regions in a planar representation of  $G$ . Then  $r = e - v + 2$ .*

# Euler's Formula

## Corollary 2

*If  $G$  is a connected planar graph with  $m$  edges and  $n$  vertices, and  $n \geq 3$  and no circuits of length 3, then  $m \leq 2n - 4$ .*

# Proof

- ▶  $G$  divides the plane into regions, say  $r$  of them.
- ▶ The degree of each region is at least four<sup>1</sup>.
- ▶ Note that the sum of the degrees of the regions is exactly twice the number of edges in the graph<sup>2</sup>.
- ▶ Because each region has degree greater than or equal to 4, it follows that:  $2m = \sum \deg(R) \geq 4r$ .
- ▶ Hence,  $2m \geq 4r$  or simply  $r \leq \frac{m}{2}$ . Using Euler's formula, we obtain  $m - n + 2 \leq \frac{m}{2}$ .
- ▶ It follows that  $\frac{m}{2} \leq n - 2$ . This shows that  $m \leq 2n - 4$ .

---

<sup>1</sup>no multiple edges, no loops and no simple cycles of length 3

<sup>2</sup>because each edge occurs on the boundary of a region exactly twice

# Proof

- ▶  $G$  divides the plane into regions, say  $r$  of them.
- ▶ The degree of each region is at least four<sup>1</sup>.
- ▶ Note that the sum of the degrees of the regions is exactly twice the number of edges in the graph<sup>2</sup>.
- ▶ Because each region has degree greater than or equal to 4, it follows that:  $2m = \sum \deg(R) \geq 4r$ .
- ▶ Hence,  $2m \geq 4r$  or simply  $r \leq \frac{m}{2}$ . Using Euler's formula, we obtain  $m - n + 2 \leq \frac{m}{2}$ .
- ▶ It follows that  $\frac{m}{2} \leq n - 2$ . This shows that  $m \leq 2n - 4$ .

---

<sup>1</sup>no multiple edges, no loops and no simple cycles of length 3

<sup>2</sup>because each edge occurs on the boundary of a region exactly twice

# Proof

## Lemma 3

*If  $T$  is a tree, and has  $n$  vertices, then its number of edges is  $m = n - 1$ .*

# Proof

## 1. Basis step:

- ▶ When  $n = 1$ , a tree with  $n = 1$  vertex has no edges. Indeed,  $n - 1 = 0$ .

## 2. Assumption step:

- ▶ Let's assume that every tree with  $k$  vertices has  $k - 1$  edges, where  $k$  is a positive integer.

## 3. Inductive step:

- ▶ Suppose that a tree  $T$  has  $k + 1$  vertices and that  $v$  is a leaf<sup>3</sup> of  $T$ . Let  $w$  be the parent of  $v$ .
- ▶ Remove  $v$  from  $T$  and the edge connecting  $w$  to  $v$ . It produces a tree  $T'$  with  $k$  vertices<sup>4</sup>.
- ▶ By the assumption hypothesis,  $T'$  has  $k - 1$  edges. It follows that  $T$  has  $k$  edges because it has one more edge than  $T'$  (the edge connecting  $v$  and  $w$ ).

■

---

<sup>3</sup> It must exist because the tree is finite

<sup>4</sup>  $T'$  is still connected and has no simple circuits.

# Proof

## 1. Basis step:

- ▶ When  $n = 1$ , a tree with  $n = 1$  vertex has no edges. Indeed,  $n - 1 = 0$ .

## 2. Assumption step:

- ▶ Let's assume that every tree with  $k$  vertices has  $k - 1$  edges, where  $k$  is a positive integer.

## 3. Inductive step:

- ▶ Suppose that a tree  $T$  has  $k + 1$  vertices and that  $v$  is a leaf<sup>3</sup> of  $T$ . Let  $w$  be the parent of  $v$ .
- ▶ Remove  $v$  from  $T$  and the edge connecting  $w$  to  $v$ . It produces a tree  $T'$  with  $k$  vertices<sup>4</sup>.
- ▶ By the assumption hypothesis,  $T'$  has  $k - 1$  edges. It follows that  $T$  has  $k$  edges because it has one more edge than  $T'$  (the edge connecting  $v$  and  $w$ ).

■

<sup>3</sup> It must exist because the tree is finite

<sup>4</sup>  $T'$  is still connected and has no simple circuits.

# Proof
